Ch.1/1

## What is a Distributed Database System?

A distributed database (DDB) is a collection of multiple, *logically interrelated* databases distributed over a *computer network*.

A distributed database management system (D-DBMS) is the software that manages the DDB and provides an access mechanism that makes this distribution *transparent* to the users.

Distributed database system (DDBS) = DDB + D-DBMS

Distributed DBMS

Ch.1/2

## What is not a DDBS?

- A timesharing computer system
- A loosely or tightly coupled multiprocessor system
- A database system which resides at one of the nodes of a network of computers - this is a centralized database on a network node

Distributed DBMS

Ch.1/4

## Distributed DBMS Environment

Distributed DBMS

© M. T. Özsu & P. Valduriez

Ch.1/5

## Implicit Assumptions

- Data stored at a number of sites → each site *logically* consists of a single processor.
- Processors at different sites are interconnected by a computer network → not a multiprocessor system
  - Parallel database systems
- Distributed database is a database, not a collection of files → data logically related as exhibited in the users' access patterns
  - Relational data model
- D-DBMS is a full-fledged DBMS
  - Not remote file system, not a TP system

Distributed DBMS

© M. T. Özsu & P. Valduriez

Ch.1/6

## Data Delivery Alternatives

- Delivery modes
  - Pull-only
  - Push-only
  - Hybrid
- Frequency
  - Periodic
  - Conditional
  - Ad-hoc or irregular
- Communication Methods
  - Unicast
  - One-to-many
- Note: not all combinations make sense

Distributed DBMS

© M. T. Özsu &amp; P. Valduriez

Ch.1/7

## Distributed DBMS Promises

- Transparent management of distributed, fragmented, and replicated data
- Improved reliability/availability through distributed transactions
- Improved performance
- Easier and more economical system expansion

Distributed DBMS

© M. T. Özsu &amp; P. Valduriez

Ch.1/8

## Transparency

- Transparency is the separation of the higher level semantics of a system from the lower level implementation issues.
- Fundamental issue is to provide **data independence** in the distributed environment
  - Network (distribution) transparency
  - Replication transparency
  - Fragmentation transparency
    - ♦ horizontal fragmentation: selection
    - ♦ vertical fragmentation: projection
    - ♦ hybrid

Ch.1/9

## Example

EMP			ASG			
ENO	ENAME	TITLE	ENO	PNO	RESP	DUR
E1	J. Doe	Elect. Eng.	E1	P1	Manager	12
E2	M. Smith	Syst. Anal.	E2	P1	Analyst	24
E3	A. Lee	Mech. Eng.	E2	P2	Analyst	6
E4	J. Miller	Programmer	E3	P3	Consultant	10
E5	B. Casey	Syst. Anal.	E3	P4	Engineer	48
E6	L. Chu	Elect. Eng.	E4	P2	Programmer	18
E7	R. Davis	Mech. Eng.	E5	P2	Manager	24
E8	J. Jones	Syst. Anal.	E6	P4	Manager	48
			E7	P3	Engineer	36
			E8	P3	Manager	40

PROJ			PAY	
PNO	PNAME	BUDGET	TITLE	SAL
P1	Instrumentation	150000	Elect. Eng.	40000
P2	Database Develop.	135000	Syst. Anal.	34000
P3	CAD/CAM	250000	Mech. Eng.	27000
P4	Maintenance	310000	Programmer	24000

Ch.1/10

## Transparent Access

```

SELECT ENAME, SAL
FROM EMP, ASG, PAY
WHERE DUR > 12
AND EMP.ENO = ASG.ENO
AND PAY.TITLE = EMP.TITLE

```

Ch.1/12

## Distributed DBMS - Reality

Distributed DBMS

© M. T. Özsu &amp; P. Valduriez

Ch.1/13

## Types of Transparency

- Data independence
- Network transparency (or distribution transparency)
  - Location transparency
  - Fragmentation transparency
- Replication transparency
- Fragmentation transparency

Distributed DBMS

© M. T. Özsu &amp; P. Valduriez

Ch.1/14

## Reliability Through Transactions

- Replicated components and data should make distributed DBMS more reliable.
- Distributed transactions provide
  - Concurrency transparency
  - Failure atomicity
- Distributed transaction support requires implementation of
  - Distributed concurrency control protocols
  - Commit protocols
- Data replication
  - Great for read-intensive workloads, problematic for updates
  - Replication protocols

Distributed DBMS

© M. T. Özsu &amp; P. Valduriez

Ch.1/15

## Potentially Improved Performance

- Proximity of data to its points of use
  - Requires some support for fragmentation and replication
- Parallelism in execution
  - Inter-query parallelism
  - Intra-query parallelism

Distributed DBMS

© M. T. Özsu &amp; P. Valduriez

Ch.1/16

## Parallelism Requirements

- Have as much of the data required by *each* application at the site where the application executes
  - Full replication
- How about updates?
  - Mutual consistency
  - Freshness of copies

Distributed DBMS

© M. T. Özsu &amp; P. Valduriez

Ch.1/17

## Distributed DBMS Issues

- **Distributed Database Design**
  - How to distribute the database
  - Replicated & non-replicated database distribution
  - A related problem in directory management
- **Query Processing**
  - Convert user transactions to data manipulation instructions
  - Optimization problem
    - ♦  $\min[\text{cost} = \text{data transmission} + \text{local processing}]$
  - General formulation is NP-hard

Distributed DBMS

© M. T. Özsu &amp; P. Valduriez

Ch.1/18

## Distributed DBMS Issues

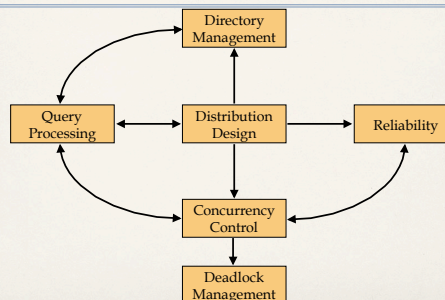

- **Concurrency Control**
  - Synchronization of concurrent accesses
  - Consistency and isolation of transactions' effects
  - Deadlock management
- **Reliability**
  - How to make the system resilient to failures
  - Atomicity and durability

Distributed DDMC

DM, T. Öner, &amp; P. Völckner

## Relationship Between Issues

Distributed DDA 69

CM T-Osses &amp; P. Velázquez

2

# Architecture

- Defines the structure of the system
  - components identified
  - functions of each component defined
  - interrelationships and interactions between components defined

Distributed DDMC

D.M. J. Ooms &amp; P. Veldhuizen

## ANSI/SPARC Architecture

Distributed DDMs

CM T. Öner &amp; P. Vekris

## DBMS Implementation Alternatives

Distributed DBMS

O.M. I. Ogun &amp; P. Valduriez

Q1/24

## Dimensions of the Problem

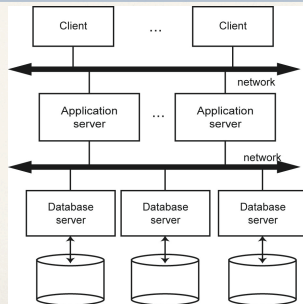

- **Distribution**
  - Whether the components of the system are located on the same machine or not
- **Heterogeneity**
  - Various levels (hardware, communications, operating system)
  - DBMS important one
    - ♦ data model, query language, transaction management algorithms
- **Autonomy**
  - Not well understood and most troublesome
  - Various versions
    - ♦ Design autonomy: Ability of a component DBMS to decide on issues related to its own design.
    - ♦ Communication autonomy: Ability of a component DBMS to decide whether and how to communicate with other DBMSs.
    - ♦ Execution autonomy: Ability of a component DBMS to execute local operations in any manner it wants to.
